Loads

Bolt anchor FAZ II Plus dynamic

Design values for cyclic fatigue loading¹ of a single anchor in cracked or non-cracked normal concrete of strength class C20/25². For the design the complete current assessment ETA-20/0897 of 20.12.2022 has to be considered.

¹⁾ The design values of the cyclic fatigue loading apply for load cycles > 10⁸ in accordance with design method I acc. to TRO61 – for unknown static lower load. If the static lower load is known and / or for lower number of load cycles higher load values are possible. The partial safety factors as regulated in the design standard are considered. As a single anchor counts e.g. an anchor with a spacing s \ge 3 x h_{et}. Drill hole cleaning acc. to assessment.

^a For higher concrete strength classes up to C50/60 higher permissible loads may be possible. - see assessment. The concrete is assumed to be standard-reinforced.

³⁾ In the case of combinations of tensile loads and shear loads, with reduced or minimum spacing and edge distances (anchor groups) the design must be carried out in accordance with the provisions of the complete assessment.
